HE announcement that

fully cloned as adult mammal.

Dolly, the name of this

startling creature, is not like

other mammals that has ever

lived. Dolly is exceptional be-

cause she has been born not

through sexual reproduction or

mixing of genetic characters of

parent's reproductive cells. The

unbelievable part of Dolly's

creation is that she is the prod-

uct of a body cell and an identi-

decided what it is going to be

when it grows up — part of bone, nerve, kidney, skin or any

other organ - it is like a audio

CD that will play only a single

track. Although every cell in

every body, from liver cells in a

person to udder cells in a sheep.

contains the complete genetic

blueprint for making the entire

person or the entire sheep, only

the genetic melody for the liver

cell or the udder cell is actually

played. The other tracks - in-

structions for the complete or-

ganisms — have been silenced.

Dr Wilmut and his team creat-

ing Dolly from the breast tissue

of a mature, 6-year-old ewe,

however, has broken this belief.

It means we have got the tech-

nique at our hand now for "re-

programming the gene expres-

sion". While some scientists

hail the cloning as a major

breakthrough for research in

agriculture, again, medicine

and genetics, others worry what

What is a Clone

ism or group of organisms de-

rived from another organism

by an asexual or non-sexual re-

productive process. A cell or

group of cells stemming from a

single cell is also called a clone.

Usually the members of a clone

are identical in their genetic

characteristics except for any

differences caused by mutation.

In nature, many small organ-

isms like bacteria, many algae,

most protozoa, some yeast and

certain higher organisms like

flatworms and plants like dan-

clones are manipulated by sci-

entists in a way that a particu-

lar gene (or genes), for example

an insulin gene (a part of DNA)

from human being is inserted

into any asexually reproducing

organism like bacteria or yeast

that can produce identical zil-

lion copies that all contain the same insulin gene. The copies

(clones) can be isolated for the

purpose of biochemical study or

for the production of human in-

sulin made by bacteria in in-

dustries. At present, not only

the bacteria carry human genes.

but the higher animals do

too. For example, there is a new

transgenic sheep called Tracy

in Edinburgh, who carry human

genes in every one of her cells.

These genes make her udders

produce human substances in

her milk, which can be col-

lected, purified and used for

that, in the early stage of devel-opment, is removed from the

uterus and split, then each sep-

arate part is placed in a surro-

gate (hired) uterus. In this case,

An embryo clone is the one

different purposes.

The genetically engineered

delion reproduce by cloning.

A natural clone is an organ-

behind?

We know that once a cell has

cal copy or clone of an adult.

Is Human Cloning a Reality?

Dr Rashidul Haque writes from Emory University, Atlanta, USA

Scottish research team has successfully cloned an adult sheep has all embryos (clones) are identielectrified the whole world. cal too. Mice, sheep, cows are This achievement made by Dr the examples of this sort of Ian Wilmut and his co-workers clones produced by this method. The latest technological deat the Roslin Institute near Edvelopment to make a clone has inburgh, Scotland, marks the first time anyone has success-

been made by taking a whole nucleus that contain the entire set of chromosomes and injecting into a fertilised egg whose own nucleus has been removed. Before the discovery of a sheep clone made by the Scottish researcher, scientists carried out successfully such experiment in frogs and mice.

History of Animal Cloning

Though plants have been cloned for centuries, the successful cloning in animals was made only 22 years ago. British biologist John B Gordon created some tadpoles from the skin cells of adult forms in 1975. But the survival rate of cloned tadpoles was very low, only one tadpole survived to maturity. JD Bromhall, another British embryologist, produced four rabbit embryos by cloning in the '70s, but he could not complete his experiment due to financial restraints.

The scientists in the University of Oregon made about 875 copies of an adult zebra fish by cloning in 1981. In the '80s, some companies in Canada and USA created cloned copies of a

imals. But this technique has been used successfully for the first time in primates (monkeys) — species close to humans. The US scientists reported in a newspaper just after the Scottish scientists announced they had successfully cloned an adult sheep from the body tissue that they have produced two monkeys from cloned embryos. To produce the monkeys, researchers harvested eggs from an adult female monkey, then fertilised each of them in vitro. After about three days, the embryos divided to the eight-cell stage of development. The DNA collected from each divided embryo cell by teasing the cells apart were inserted into fresh egg stripped of its DNA. Nine such successfully developed embryos were im-planted into adult females out of which two live births re-

sulted. Cloning of Humans — Next Step

In spite of strong objections on religions and moral grounds, many scientists now think that it is only a matter of time before the technique is applied to human beings. The experts say either greed, scientific drive or a misguided desire to play God will drive some researcher somewhere to take the plunge into mankind's

Professor Robert Schoysman, head of the team at the Helmont Hospital in Vilvoorde rejected such report and said that his laboratory practices in viro fertilization and deal with about 800 cases a year. His laboratory uses a different approach called 'hatching technique' where a frozen human embryo is thawed and the surrounding membrane is rubbed so that the chances of egg escaping and it's implantation into the mother's uterus are improved. The Professor said that though the embryo can later divide and produce identical twins, but his experiment is

cloning. However, the Belgian

The first-ever cloning of an adult mammal (a sheep) has raised serious ethical questions about where the experiment will lead. Twenty years ago, when only the tadpole had been cloned, bioethicists raised the possibility that scientists might someday advance the technology to include human beings as well. Now, the cloning of a mammal is done and of a human being is within easy reach. Scientists opinion in the US has been divided on the prospect of human cloning. According to a CNN/Time Poll based on interviews with 1005 adult Americans, most Americans think that it is morally

nothing related to the cloning.

victimised because this is the only natural way we have to get baby. Who would intentionally bring a deformed, pain wracked child into the world if it could be avoided? The new technology can positively help a couple who have high probability of passing a genetic disease to their children by cloning just one parent, resulting in a disease-free child. This could be a twin son version of a parent.

Couples who are otherwise unable to have children due to such problems as sterility, will now be able to have a child that is still biologically theirs.

If such a situation happens that a child died and the parents want another same child, then another cloned embryo (which could be done when the first child was in the embryonic stage) could be implanted in the mother's womb again. Then, she would give birth to another child who could be the exactly same as the child that she just lost.

We cannot bring Rabindranath Tagore, Beethoven, or Albert Einstein back any more in our society. Their bodies and DNA have long been decomposed. But we have other talented people now in our society like scientists, athletes singers, poets, politicians and others whom we can think about and have their several

copies. There are several signif

icant factors need to be consid-

The British scientists has undoubtedly stunned the whole world by cloning an adult sheep from a body cell. This is indeed a very big step forward in the scientific world. The modern genetics and genetic engineering technology started their initial steps only in the '50s, after James Watson and Francis Crick discovered the chemical structure of the DNA molecule. Now, genes from human are already working in microbes, fish, rabbits, mice, pigs, sheep and cows. The human society is getting a lot of outstanding benefits from the gene cloning technology. On the other hand, the scientists always faced a lot of pressures from the society whenever they discovered some novel staffs beginning from the antibiotics to the creation of Dolly. Antibiotics and other modern medicaments can be said unnaturally prolong human life, and yet not many object to these anymore. We should keep it in our mind that

The technology inherent in such a process, however, would have many scientific and medical benefits that would spin off. This should be allowed to progress unhindered. Many things in this world will change in the future, as they have in the past, but procreation will continue and few of us would choose to be reborn, even if that

became a viable option.

do is to proceed slowly and very

cautiously. Since we now have

the ability to alter life on earth,

Jurassic Park, the scientist created the dinosaurs from the mosquito blood that contained dinosaur DNA. The mosquito was trapped in an amber fossil some 65 million years ago. I watched two movies on human cloning and thought how people's mind could think of possible human cloning in future some 23 years ago. One was a classic comedy of Woody Allen of 1973, Sleeper, where he was trying to get their leader back, who died in a terrible bomb blast, by cloning from his only remaining tissue of nose. Thesecond movie, the Boys from Brazil of Gregory Peck, was a serious one.

Thinking that scientists one day can clone an individual from a single cell, Adolf Hitler offered some cells from his blood and rib muscles which he ordered to freeze for future use. After the World War II was over and Hitler died, a Nazi scientist took Hitler's frozen cells, made 94 clones of Hitler and spreaded all over Europe and North America again to make Hitler of the 1980s, 1990s and 2000. In the movie, they tried to perpetuate evil. Watching two movies I figured out two things. In Sleeper, people were desperately trying to have their great leader back, because they were running a leaderless society; and in the second movie, the Nazis were trying to perpetuate the leader of terror all over Europe and America again. It means, people could use this technology in both good and bad purposes. There is no such thing as bad science or technol-

is new here. When 'cinema ogy, only bad applications. class people, it is hardly surprising that there is a whole generation of us who have grown up without any idea about the magic of big screen. To us, movies mean a 20-inch climax situations, a video cassette that has been thrown hell on wheels, judging from the way it jumps around the place, presenting the scenes amidst a dense pall of smog, or so it seems. And to think that we sat silently all this while and compromised! This is really a weird city, when you take into account resignation and complacence in matters like this. It's not like people aren't having fun here. Some have LDs set up to reconstruct tinsel charisma in the confines of a stereophonic acoustics creating an apparently exact reproduction of a theatre interior (!). Then we have the other strata of society who are obsessed with PCs. They think that a VCD run there is no such thing as bad on a 14-inch SVGA monitor. science or technology, only bad cooped up in a corner of the application. It is the people who misuse it. The best thing wetten

we had better think hard about the kind of world we want. It is no good simply reacting to today's headlines with dismay and revulsions. I am not advocating spawning an army of emaplexes. What a waste of metropolis.

sight-seeing time!

For the movie buffs, Dhaka

can be a disappointment. It It's not like there are no doesn't have a single cinmovie theatres in Dhaka or that they don't screen internaemaplex, much less a multiplex. Even the concept of a multiplex tional movies, it's just when it comes to acclaimed A grade halls' are taboo for the middle movies that they shy away. Otherwise they are all too willing to screen third rate, soft porns with suspect titles at all hours of the day, round the year. Their defence is that, people who usually frequent these TV, a VCR with a quirk for joints cannot appreciate criticonking out in the middle of cally superior cinema. Their attitude reminds me of the age old dilemma: which came first, the chicken or the egg? Was it third rate movies that drove us away or has our not showing up resulted in the theatres being obliged to switch to porn for survival? Talk like this only ends up depressing me, so lets just look at the bright side. since there is one.

single embryo, mass-producing it may portend. If sheep can be identical cattle a few dozen at a duplicated — are humans far time. But these cattle are clones of each other, not any adult an-

Dr Ian Wilmut, a Scottish researcher, improved a masscloning technique in sheep that could create potentially hundreds of animals at a time. In 1997, he produced a healthy baby sheep, named Dolly, from single mammary gland cell of an adult sheep. And this is the adult mammal cloned for the first time in the history of animal life.

Technique for Sheep Cloning Dr Ian Wilmut and his col-

leagues used the following techniques for successful sheep cloning. They took unfertilised eggs from an adult sheep and mechanically removed the egg nucleus which contains the genetic material (DNA). They then took cells from another sheep's mammary gland, kept them in a test tube and inactivated the cells by limiting their notri ents The DNA materials from the mammary cells were introduced into the unfertilised egg cells. An electric current was applied to jump-start the egg and stimulate the burst of energy that occurs during fertilization. In Ian Wilmut's experiment, only 29 out of 277 fused egg cells survived for a few days Eventually, the surviving embryos were surgically implanted into the uterus of 13 ewes one of which became pregnant and gave birth to Dolly.

Cloning in Monkeys

The cloning technology or nuclear transfer technology in this case producing animals from embryos is not new. This technology has already been applied to mice, rabbits, cows, pigs and sheep, among other angenepool. Dr Arthur Derse, director of Medical and legal affairs at the Center for the Study of Bioethics in Wisconsin, USA said: "It's the kind of thing that once it is out of the bag, you are not going to get it back in. There is no theoretical reason why it couldn't be done in human beings right now". The British scientist responsible for Dolly said that human cloning could be possible in two or three years but he also added that there should be international laws to prevent such works. Nature, the top ranked scientific journal that published the Dolly's paper (Feb 27, 1997) editorialised "Cloning humans from adults" tissues is likely to be achievable any time from one to 10 years from now. Dr Phillip Wyatt, Chairman of the Genetics section of the Ontario Medical Association, said: "There are reasonable circumstances in the future where cloning of human material would be quite desirable".

In 1998, Dr Jerry L Hall at George Washington University cloned human embryos A he took cells from 17 human embryos, all two to eight cells in size. He teased apart the cells, grew each one in a lab dish and got a few 32-cell embryos — a size that could be implanted in a woman. This news struck a moral blow around the world the first time any one had dared violate the sanctity of creation since abortion. Dr Hall's idea for the embryonic cloning was one of the promise for peoples who might have troubles inseminations, low egg counts, infertility and situations of the like. The project has not yet produced any children. Now we know that human clones have already been born in Belgium using the method of embryonic

unacceptable to clone either animals or humans. President Bill Clinton has ordered a special panel to review the ethical implications on this scientific breakthrough. Pope John Paul II called for a ban on cloning of humans and told that this type of dangerous experiment would harm the human dignity.

Some Benefits from **Human Cloning**

Human research can be simplified by cloning some people and use them in experimentations on drugs and others. By doing so, we would rule out the variable that exist now between people who are not identical

Besides the cloning of entire human being, we could clone different vital organs (liver, heart, lung, pancreas or kidney) of a body separately which would be very valuable. For example, pancreatic

cells from a diabetic patient or kidney cells from a person with damaged kidney could create a second panereas or kidney and them in sheep or some other hosts and have them regrow 3MN So, people who can use their pancreatic or kidney cells, for example, to have them regrow in other animals as a spare part of their own body organs, can now get them transplanted back in their body. However, to do so, enough precautions need to be taken so that the viruses or other organisms that inhabit animals are not transferred to humans.

A lot of people carry very deadly genetic diseases in their gene pools and through marriage and the way of sexual reproduction, parents pass those deleterious genes to next generation affecting their innocent children. The children should not deserve this, but they get

ered to have the exact copy of qualities in the clones in all respects including personality and character, intelligence and talents of which the family and institutional environments are very important. Some people say that it is impossible to recreate John F Kennedy without also equipping him with a domineering father and a dead older brother whose footsteps he was destined to follow. It is not that necessary to clone yourself while you are alive. It can be done even after your death, because you can freeze some of your cells down for further use, and then you can be resurrected. Would you like to be offered another chance at living?

I do not disagree that some bad outputs may come out of human cloning. We never want in this civilised society to create more copies of evil characters. If the cloning of individuals is a reality, then the military application, for example, is truly frightening. The possibility of a race with superior militaristic capabilities is terrifying. Applications like these must be banned. We should have very rigid national legislations to control the application of this technology in human be-

Yesterday's Science Fiction is Today's Reality

News of Dr Ian Wilmut's experiment resonated worldwide. It immediately reminded people of science fiction tales involving cloned armies, the resurrection of dictators and various quests for immortality. There are several movies centred on cloning as a science fiction of which the Jurassic Park got a huge popularity in the world. In
