Bangladeshi scientist identifies kinesin related protein

A young Bangladeshi biochemist has identified a new kinesin related protein, KLP-3, which plays a significant role in the early stages of cell multiplication, reports UNB. Infants born without KLP-3-like protein may face problems such as mental retardation, prevention of breast development in females and underdeveloped testes as well as little body hair in males.

Kinesin, a transport protein, was first discovered in 1985. It functions as a carrier of neurotransmitter, which carries signal between brain cells.

Transport proteins normally act as the carrier of different cell-forming materials like neurotransmitter, chromosome and mitochondria at the very early stage of cell division.

The new protein, KLP-3, was identified by Dr Mohammad Liaquat Ali Khan in 1996 during

his Ph.D work in Japan. He did his Masters in Biochemistry from the Dhaka University.

KLP-3 plays an important role in segregating chromosome during the embryonic cell-multiplication. Chromosome is the most important factor in body development as it stores the blue print of all the living systems.

Without segregation of chromosome, normal cellular multiplication cannot take place resulting in spontaneous abortion.

The young Bangladeshi biochemist did his experiments on the multi-cellular eukaryotic organism, nematode, which is used worldwide as developmental animal model for its short generation time, simple growth condition, small genome and small size.

His finding was published in the Journal of Molecular Biology, an international publication.

Qulkhwani

Qulkhwani of Faridur Rahman will be held at his 2/19, Noorjahan Road, Mohammadpur residence after Magrib prayers today, says a press release.

He was manager (accounts), District Sales Office, Biman, Dhaka and was on LPR. He died on Saturday last following a massive cardiac arrest.
