A Global Shortage of Leaders

by a Husnain

The famous best-seller 'How to Win Friends and Influence People' perhaps is not applicable to political leaders, who thrive on the cunning divide-and-rule philosophy.

LOBALLY, there is an Tacute shortage of great public leaders (including political leaders who hold control over millions of minions (chelas) and minnows (puthi maach), with nasty de-

controlling effects! There are only two living personalities who come to the mind readily. One is Mandela, and the other is closer to home. One does not believe in feeding hatred, and practises what he believes; while the other holds the record for two decades of leadership over a race who are fond of changing leaders for no apparent reason - just being phlegmatic, perhaps.

The age of leadership might

be in the waning phase, because this is the age of change - nature has its own secrets about these cycles of change affecting the mind and matter. The weather (climate) pattern is also changing, with a sample demonstration coming from the recent periodical El Nino effect (warming of sections of sea water which affect weather globally). Here in Bangladesh, no fan was needed even in April Fools' Day, when in India the temperature rose to 450C, complained the Aussie cricket play-

A great leader will not encourage division. The famous best-seller 'How to Win Friends and Influence People' perhaps is not applicable to political leaders, who thrive on the cunning divide-and-rule philosophy.

Bangabandhu Sheikh Mujibur Rahman was a great natural leader, above politics, although he used a political platform for his noble mission. That does not mean he was necessarily also an astute politician or administrator. Nehru was not a pucca politician, nor was Mahatma Gandhi. Abe Lincoln was learning politics till he was assassinated.

True leadership is of a different mould, and not bound by evolutionary civilizations. The style and the principles are timeless, and not confined to geographical limits and manmade laws and theories.

In the field of politics the presence of statesmanship has dwindled alarmingly. A true leader needs no outside or group support. He will attract others, and not the other way round he will not go out of his way to seek support. It is the magnetic pull of the personality and the

principles advocated.

The mighty British of the Raj days were humbled by a half-clad person travelling with a goat. They had to bow to his moral force which swayed 400 million people (we are talk-ing of the ordinary mortals, not the messengers of God).

ATURAL gas is one of the world's principal fuels. It has long been looked upon as a by-product of the production of crude oil. At one

point, Saudi Arabia flared this

by-product at the rate of one

billion cubic feet a day.

Compared to their daily

earning of 200 million dollar

from oil production, the value

of the flared gas was a mere 3

million dollar a day! Things

have changed ever since. Export

outlets to an increasing market

demand and strict environmen-

tal restrictions have now forced

the burning rate to an accept-

able level. Increasing environ-

mental awareness and the fact

that natural gas is a much

cleaner fuel along with cyclic

price hike of crude oil has made

the use of natural gas very popu-

lar. The industrial countries of

Europe and North America

make extensive use of natural

gas, through vast gas pipeline network using indigenous re-

sources. Japan is an exception to this trend in the industrial-

ized world. Having little natu-

ral gas resource of its own, it

heavily depends on imported

Liquefied Natural Gas (LNG).

Japan imports almost 50% LNG

of the world trade. Bangladesh,

like most other countries of the

world has found gas in connec-

tion with its effort to find crude

on natural gas, some facts and

limitations of natural gas in

handling it as a commodity

must be understood. In contrast

to crude oil which can come to

rest in lease stock tanks after it

is produced, natural gas keep

flowing from the wellhead to

the end-users through the

pipelines. Flow rates and sup-

plies are controlled at the well-

head depending on the require-

ment of the end-users

(households power generation

companies, fertilizer compa-

nies etc). The tremendous capi-

tal requirement of pipeline

constructions have precluded

the proper development of this

resource in many countries.

Some huge reserves of natural

gas have been shut-in in USSR

Algeria, Australia and Peru. So.

it is obvious that developing the

ground facilities (pipelines and

end-users) either before or dur-

ing the development of gas

fields is imperative before any

gas purchase/sale contract

could be signed. Typical con-

tracts will have a provision of

"take off pay for" clause in

favour of the supplier's interest

as it is very difficult to stock

ment of the multinational oil

companies in petroleum sector.

one has to understand the

petroleum busmess. Unlike

other industries, where all pos-

sible inputs and outputs are

To understand the involve-

Before any other discussion

Civil strifes are caused by the civil persons, and are products of the Ego, tuned to the lust for power (other fringe benefits follow if the same is misused). In today's changing world (due to the impact of information technology), the subjective styles and goals have to be reviewed in more than transient depth; but even then IT will break through the non-transparency. There is no place to hide, nor the time. Today's public temperament is different.

The mores of the society's leaders affect the followers. Genunine leaders are not affected. as truth does not change with ideas or 'isms'. Therefore the followers of truth are not affected by the surrounding chaos. Temporal changes affect temporal minds and philosophies. The majority need guidance, first mundane and moral, and then spiritual.

The problems are in the processing stages, because each person is different, and has to be tuned and retuned to the norms of the groups or teams in

The system analysis as applied in computer science cannot be applied to politics as the latter is reactive and humanized. A computer is neither human nor inhuman. Stark reality has no shield, cover, shade or canopy. It is all one's relationship with the surrounding space. First tune the inner space, then the outer. Cable TV is not a discreet connection. Hitch your power trolley to divine energy.

That is the beauty with the human beings, each person (of the five billion) is different. which makes life worth living. The interactions, harmonious or otherwise, are subtle lessons in the development of the self and the society. Therefore the sociologists start with the family as the unit, and move out-

wards in ever-widening circles. Then what are the basic and projected roles of political leadership? Let the leaders respond to this poser, especially as applicable to this country.

Oil and Gas

Business, Multinationals and Bangladesh Perspective

by Dr. M. Tamim

The model production sharing contract prepared by Petrobangla is similar to the present international practices. Irrespective to the numbers used in the contract (which varies from country to country), the success of such contract solely depends on the strict monitoring by the host country. At its present state, Petrobangla is not equipped even to monitor the existing Production Sharing Contracts. Large scale rapid human resources development is essential to equip Petrobangla for such a task.

generally known with a fairly high degree of confidence, one of the most important ingredients for petroleum industry is always unknown at the advent of such undertaking - that is the availability of the resource itself. Before one can talk about any sale contract of gas, a substantial amount of activities have to be organized successfully. The culmination of a successful commercial gas production is preceded by the exploration and development stages. It is the exploration phase which makes this oil business one of the most risky and uncertain endeavour. Millions of dollars have to be invested in different geological surveys and digging of exploration wells, in the hope of making a commercial discovery. Failure means millions of dollars going down the hole. Development and production phases also involve large investment and risk. Apart from the lack of access to investment funds, many developing countries have difficulties in accessing the technology. organization, skilled manpower, risk management skills and special hardware required by the petroleum industry. A country may seek business partnership from the multinational companies for any or all

of the above reasons. Partnership between host country and multinational oil companies are generally based on the fundamental concept of mineral ownership and characteristics of petroleum tax systems. The French concept of mineral ownership which has been used since Napoleon's time treats surface and sub-surface ownership separately. In this system, individuals may own the use of surface right but anything under the ground is owned by the community and hence by the state. Because mineral are found naturally under the ground, individual benefits are denied. On the other hand, the Anglo-Saxon tradition which evolved mainly in the USA does allow some select individual ownership of

sub-surface mineral. The two popular form of

agreements -- Concession Contracts and Production Sharing Contracts (PSC) are somewhat related to the ownership concept. Concessions were the dominant form of leasing acreage through the mid '50s. Most countries in Europe and America still utilize the Concession method. Under the Concession system, the land owner (individual or state) assigns the right to the contracting company to explore and develop petroleum. In return the company pays royalties, taxes, rentals and bonuses - in combination of some or all of these. Royalty and Taxes are the basic economic feature of the Concession system. Generally, the conditions included in a Concession system are fixed in advance, usually by legislative action. Produced oil and gas is owned by the company. In this system, the royalty is taken from the gross revenue which ensures a steady income for the Government even if the operations prove unprofitable. The income tax (generally at national corporate tax) is levied on net earnings. The company will pay all of the exploration and development cost at its own risk. Dispute in profit calculation, excess profit (due to low operation cost or higher fuel price) and host country participation have led many countries towards a contractual taxing

system. Production sharing has its roots in agricultural applications which is practiced in many countries including Bangladesh. The principal economic factors are cost recovery provision, production sharing and taxes. The costs and risks involved in exploration and development are borne by the company which it recovers from a negotiated fraction of production. The remaining production is split between the company and the Government to an agreed formula. The production split may range from 15% to the Government and 85% to the company (Chile) to 85%/15% (Egypt). This may also vary with daily production

the production share of the oil companies are subject to income tax. The Government owns the petroleum under a

contractual system. No matter which form of agreement is signed, it must satisfy the objectives of the host country. These objectives are linked to the envisioned role of petroleum within the domestic economy. If petroleum is the major export item (after satisfying all domestic needs) as in the OPEC countries, objective should be set to maximize export revenue. On the other hand, if petroleum is the basis for developing domestic economy, all emphasis should be focused on a strict time control in producing the limited non-renewable energy resource.

The objective of the oil companies is to maximize their profit. Obviously, any action taken by the host country which would drive the profit below a minimum acceptable level will force the companies out of the country. Satisfying and balancing the objectives of both the sides are tricky business. Ideally, the host country would like to

(1) Maximize the revenue without hindering investment

(2) Promote the rate of investment in developing the petroleum resources keeping the country's long term economic policies in context

(3) Influence the level and geographical pattern of explo-(4) Encourage backward and

forward linkages on the domestic economy (5) Ensure participation of the national oil company to

technology.

develop human resources for the country

The long-term economic objective should be reflected in the national energy policy. The objective set in our petroleum policy of '93 mentions that the exploration and exploitation of petroleum resources would be done in rational manner for a sustainable development of the country. It also states that private sector participation would be encouraged in the petroleum industry and trade. Unfortunately, our energy policy failed to determine the role of petroleum in our long range economic need. Because of lack of knowledge of the resource potential and an analysis of the possible scenarios encompassing the range of discovery, the whole country was offered for exploration and production bidding. This decision is a natural consequence of an export oriented policy which was not identified in the national energy policy. What is the potential reserve

Bangladesh Context

of the country? Different figures are heard from different quarters. The local geologists and engineers put this figure at a maximum of additional 20 tcf. whereas some foreign journals/newspapers/companies predict a number as high as 80 tcf. The calculation methods vary so widely that any number out of a hat would suit one's interest. It is in the interest of the shareholders of multinational companies to project a higher figure - both for stock price and contract negotiation. Due to sole dependency on this only

natural resource of the country. Bangladesh's policy objective should be based on the conservative numbers. This would enable us to explore and develop this most important resource in such a time-controlled manner that it would support domestic industrial growth consistent

with our long term economic projection. So the decision which has to be taken is whether the potential gas reserve is so high that it can be used as a major export item or it

growth demand.

Right now Cairn Energy is

the only PSC partner who has

gone into commercial produc-

tion. It is supplying 60 MMscfd gas to the national grid line, al-

though it can supply 160 MM-

scfd. Petrobangla is not taking

the full capacity either due to

lack of pipe line capacity or

lack of end-user. There might be

other reasons but this is one

company and one gas field. Ac-

cording to model production

sharing contract, if the gov-

ernment cannot indicate an

outlet for a commercial discov-

ery within 6 months of its dec-

laration, the company would be

allowed to find a market within

the country. The question is

who is going to buy that gas

within the country? Private

power generation units, distri-

bution networks, fertilizer

companies have to be ready to

utilize that gas within 6 months

of its discovery. Otherwise the

companies will have to export

its share of the gas. In a worst

case scenario, if all the compa-

nies make at least one commer-

cial discovery (strong possibil-

ity is there for more than one

discovery) within three years of

signing the PSC, the Govern-

ment will be forced to allow the

supervise, transfer of

monitor the performance should be perceived as a limited resource which would mainly be required to support domestic

companies to export their share of the gas. To worsen the situation, a number of fields discovered by BAPEX (i.e. Semutang, Jalalabad, Kutubdia) have been rewarded to the existing PSC partners as incentives. Perhaps the second round bidding was organized much earlier than the country's requirement.

If it is perceived that

Bangladesh cannot afford the export of its valuable limited natural gas resource, the role of the national oil company has to be strengthen. The three reasons for inviting multinational oil companies are lack of investment capital, lack of technical know-how and risk involvement which have been mentioned before. For Bangladesh, shortage of capital is the principal reason for inviting international oil companies. This does not mean that it cannot provide any money to support and gradually develop a strong national oil company. BAPEX has the technical knowhow and the manpower (which is dwindling every day) to fulfil its role as a strong national oil company. Obviously, the Government should allocate BAPEX the lowest risk areas for its exploration and production activities. These areas should also interest the investment by international financial institutes. The national energy policy also recommended allocation of funding to support the drilling of four wells per year by BAPEX. If no block is kept aside for such activities, where would the wells be drilled? As Blocks 9, 10 and 11 are considered the most prospective (hence lowest risk involved), these blocks should be taken out of the bidding table and exclusively kept aside for the national oil company. The strike rate (discovery/exploration well) of BAPEX is enviable by any standard. The national oil company has discovered 20 gas fields and 1 oil field drilling only 55 exploration wells. The success ratio being 2.75:1. instead of the recommended four wells/year if BAPEX is allowed to drill even two wells/year, Bangladesh would be immensely benefited and will have a far better control of the timing of its gas production. Between the two types of

agreements which are most widely used all over the world, production sharing suits Bangladesh better than the concession system. Calculation of profit which is much more tricky is the principal point of dispute in the concession system. Recoverable cost calculation is the main battle ground in PSC. Strict monitoring of drilling, development plans, production management serve the interest of the host country. Production sharing being a legal contract, detailed discussion on different aspects of the PSC is beyond the scope of this paper. Generally speaking, the model production sharing contract prepared by Petrobangla is similar to the present international practices. Irrespective to the numbers used in the contract (which varies from country to country), the success of such contract solely depends on the strict monitoring by the host country. At its present state. Petrobangla is not equipped even to monitor the existing PSCs. Large scale rapid human resources development is essential to equip Petrobangla for such a task. Apart from recruiting and training different professionals, an active national oil company with competitive salary structure is a requirement to reap the benefits of such contracts. The newly offered PSCs should be consistent with the ground facility development (pipeline, end uses) along with a planned time frame for produc-

Silent Discrimination: Case of Rape

INDINGS of a study reveal Rape is not the only crime in → that only one in ten cases of **A** rape is reported to the police. Why don't women report these crimes? Some are afraid. Some are ashamed. All too many have learned that the system serves the interests of men and puts women victims on trial. This is because a rape victim is a marked woman all her life, a damaged being. It hinders the marriage prospects of the victim and others in her

family. In most of the criminal cases, there is enormous bias against the defendant simply because s/he is arrested. Juries assume that s/he must have done something wrong. Except in rape. In a rape trial, the defense attorney has the edge. Instead of assuming the defendant as guilty, the jury assumes the victim either provoked the at-tack or made it up. "I can't sex victim is zero. think of one other criminal of-

prosecutor said. Rape is a problem for the justice system in part because it is a unique crime. The act of sexual intercourse can be love or it can be rape, depending upon whether both parties have consent to it or not. So the prosecution in a rape trial must prove the woman did not consent. That is difficult if the victim knew the rapist, which usually is the case; if there were no witnesses, which is nearly always the case; or if there are no bruises or other signs of strug-

fense where the victim is

blamed so routinely," a public

If the rapist had a gun or knife, if there was a group of assailants or if the woman decided it was fruitless to struggle, the case comes down to her word against his. And traditionally, juries believe him not her.

In ancient times, when women were regarded as the property of first their fathers and then their husbands, "consent" had nothing to do with rape. A man who deflowered a virgin not his wife was guilty of rape. He was ordered to marry the girl and pay her father the equivalent of what an intact virgin would have brought on the marriage mar-

There was no such thing as rape of a married woman. If attacked, she was expected to fight to the death rather than give up her precious virtue (and her husband's good name). If she was unfortunate enough to live through the attack, she was guilty of adultery.

How far have we come? Only within the past 25 years have rape shield laws barred a victim's past sexual relations from being introduced as evidence in a rape trial. It remains more difficult to convict a man of raping a divorced woman than as "innocent" one.

which the system fails to treat women fairly. Wife beating wasn't even a crime until the 1800s. Woman battering by husbands or other male counterparts is a recent phenomenon in our country. Often their attempts to get protection from the justice system fail. In a recent study, it has been found out that in some cases when a victim seeks help from the thana, the police, usually, instead of recording FIR, places the victim under section 290 of CrPC. According to this section, the girl is 'bad' and has provoked the incident she is reporting. This shows that section 290 of CrPC prepares a victim-harassment at the thana if she wants to file a case. Under such hostile circumstances chance for getting justice for a

Even the court environment is hostile to the young girl. Vulgar interrogation further worsens things due to which she can't give proper evidence. And when they fight back and kill their abusers, the courts treat them more harshly than they do men who kill their wives or

girlfriends. In USA, according to statistics compiled by National Clearing House for battered women, the average prison sentence for abusive men who kill their mates is two to six years. The average sentence for women who kill abusive men is 15. We have to find out whether this type of discrimination exists in our judiciary system.

Living within this discriminatory arena, without the justice system to protect them, women have found ways to protect themselves. They taught their daughters to be 'good' and follow the rules. 'Never talk to strangers. Never walk alone at night. Never wear revealing clothes. Never look at strangers. Never take buses. Never leave the house. Of course, there is always the chance you will be raped at home. Better get married so you'll have a man around to protect you.'

Since Susan Brownmiller's landmark book on rape, Against Our Will: Men, Women and Rape, was published in 1975, women have recognized that fighting violence against women means more than avoiding dark alleys. Brownmiller dispelled the myth that women are better off if they submit to rapists. And they are fighting to change the systems through the courts, parliament and state legislatures. Yet changing laws is only the first step in reforming the system. We have to change attitudes. One attitude we have to change is the notion that when it comes to sex, 'no' means 'yes.'

Men didn't make up the notion that 'no' means 'yes'. by Tahera Jabeen

Those parents who taught their daughters to be 'good' fostered it. For generations, they raised girls to believe that only bad girls have sexual feelings. Consenting to sex or, heaven forbid. initiating it would be acknowledging 'bad' feelings. What a way to mess with a normal adolescent's already fragile self-esteem.

For generations girls dealt with this dilemma by denying their sex drive. That was easy enough. Their male counterparts were willing to take all the necessary action, so the girls could feign resistance as a way of experimenting with sex without taking responsibility for it, without being bad girls.

Of course, once girls forfeited their integrity on the question of consent, it was difficult to get it back. Once boys got the word. the word that 'no' sometimes meant 'yes,' it was open season on resisting females.

Imagine a society in which when a woman says 'no,' a man stops. One male person I spoke with suggested that in such a society there would be a lot less sex and a steep drop in the birth rate. I doubt it. I think that if men backed off from women who said no, more women would say yes.

It's hard to change 3,000 years of attitudes, but parents and teachers, judges and lawmakers can help. We can start by teaching little boys to respect the feelings - and words - of little girls. And what do we teach little girls?

In today's world, a mother wants to protect her daughter from harm just as her parents wanted to protect her. But the days are long gone when girls

ther's house to their husband's. Now-a-days, what can a mother do if she wants to protect her daughter from harm? I hope that she can teach her daughters more than just how to avoid being alone with a man

in an elevator. They should

rates and with time. Generally

study karate as well as ballet. In future, I want my daughters to understand their own strength, the importance of knees and elbows, the power of a well-placed kick. I hope to see them to understand the difference between 'no' and 'yes.' While I'll probably preach the virtue of 'no'. I hope I won't lead them to think that there is something wrong with them if they have sexual feelings. Fil teach them that the justice sys-

use the system, but not trust it. and work to reform it. One of my relative was telling me about being raped many years ago. She was young
