# SAPTA to SAFTA: Need for a Moratorium?

by Zaid Bakht

Historically, the trade performance of SAARC countries varied significantly because of the difference in the size of the respective economies, their structure of production, and pursuance of divergent macro policies ... If SAPTA has to impart equitable benefit to the South Asian economies, the concessions granted to LDCs will have to be substantive. Granting of unilateral free trade facility to LDCs and relaxing the rules of origin are of prime necessity

arrangement would depend on the trade-off between the trade creation and trade diversion effects. This in turn will depend to a critical extent on the initial conditions, resource endowments, production structures, structure of export, export-import complementarities, com-The Move Towards Regionalpetitive strength and relative comparative advantage.

In the situation where the size of the production base varies between the member economies in a big way, the trade diversion effect is likely to be higher for the smaller economies and as a result the accrual of benefit is likely to be less for the smaller economies compared to the larger ones.

Thus, when member economies are of unequal size and strength, the asymmetric incidence of benefit of preferential trading arrangement in favor of the larger ones remains as a major risk factor.

The Pattern of Intra-regional Trade: International trade has in general played a relatively smaller role in South Asian economies because of the inward looking development strategy, which the economies of the region historically followed. Even in 1996, the share of South Asia in world export barely met the 1 per cent mark.

Within this small volume of international trade undertaken by South Asia, intra-regional trade features even less significantly. Import from intra-regional sources was 1.9 per cent of the region's import in 1985 and it rose marginally to 3.7 per cent in 1996. The share of export going to the region in the region's total export was 4.5 per cent in 1985 and it came down to 4 per cent in 1996.

The small volume of intraregional trade again has a lopsided distribution amongst the countries of the region. India is the dominant player in the intra-regional trade flows accounting for 57 per cent of intra-regional export in 1990. On the other hand, Bangladesh dominated the scene with respect to intra-regional imports. Bangladesh accounting for nearly 36 per cent of all intraregional imports flowed into

Bangladesh. It may also be noted that compared to 1990, India's share in intra-SAARC export has registered a sharp rise (from 57.3% to 79%) in 1996 whilst her share in the intra-regional imports has registered a significant decline (from 13.9% to 7.1%). In contrast, Bangladesh's share in intra-regional export declined from 7 per cent in 1990 to less than 3 per cent 1996 while its share in import registered sharp rise.

Bangladesh's Trade Deficit with South Asia: Between 1985 and 1996, Bangladesh's import from South Asia increased at a compound rate of 27 per cent anum. For 1990-96, this rate was 30 per cent per anum. Bangladesh's overall import grew at a lower rate during the corresponding periods. As a result, the share of imports from South Asia in Bangladesh's total import rose from 3.5 per cent in 1985 to 17.5 per cent in

India and Pakistan are Bangladesh's major trading partners within the SAARC region accounting for more than 95 per cent of her imports from South Asia and 75 per cent of her exports to South Asia. Between 1985 and 1996, Bangladesh's export to these countries registered absolute decline. As a result, Bangladesh's trade deficit with South Asia expanded at a very rapid pace. In fact, Bangladesh incurred deficit in trade with all six SAARC countries in 1996-97.

The above data relates only to legal trade. If one adds to this illegal import, which is esti-

mated to be between 125 and 150 per cent of legal import from India, the extent of deficit would rise even further. A study carried out on cross-border trade in 1994 found that more than half of the illegal imports consisted of agriculture, livestock, fishery and poultry products. Most of the manufactured items belonged to the consumer good category. A recent up-date of the study has found that certain capital good items such as automobile parts have gained in importance in the smuggled goods basket but the dominance of agriculture, livestock, and manufactured consumer goods has continued.

Unlike her imports Bangladesh's export to South Asia has a very narrow base. Only six items, namely, raw jute, fertilizer, jute goods, frozen fish, tea and leather accounted for 92 per cent of Bangladesh's export to the region in 1995-96. Similarly, illegal export is also comprised of lew goods. Only four items, namely, copper & brass, hilsha fish, synthetic textiles and electronic parts account for 92 per cent of all illegal exports.

Factors Contributing to Bangladesh's Trade Deficit

(a) Faster Trade Liberalization: The proximate cause behind Bangladesh's growing trade deficit with her SAARC neighbours is the faster pace at which trade liberalization was implemented in Bangladesh. As can be seen from Table 1, unweighted average tariff rate in 1995 was higher in both Pakistan and India - the two major partners of trading Bangladesh.

Bangladesh also dismantled her non-tariff barriers fairly rapidly. Between 1990-91 and 1995-96, the number of HS 8digit controlled items were brought down from 21.5 per cent to only 2 per cent of the total number of tariff lines. In contrast, 44 per cent of the tariff lines in India, most of which were consumer goods, were subject to virtual import ban in 1995.

(b) Exchange Rate Apprecia-

tion: The second proximate reason behind increase in Bangladesh's trade deficit with India and Pakistan is the appreciation of Taka vis-a-vis Indian and Pakistani Rupee. As Table 2 shows, the nominal exchange rate vis-a-vis these two currencies appreciated secularly between 1990 and 1995. Evidence also suggest that similar trends persisted with respect to real exchange rate also.

(c) The Role of SAPTA: According to the stated basic principle, SAPTA is to involve exchange of trade related concessions in a way that is equitably beneficial to participating nations. In assessing equitable benefit, respective levels of economic and industrial development are to be taken into account. In particular, the least developed members are to be accorded concrete preferential measures in their favour. The concessions are to be provided in relation to tariff, para-tariff, non-tariff, non-tariff and direct trade measures. Direct trade measures include negotiation of long term contracts with a view to assisting LDCs to achieve reasonable levels of sustainable exports.

Thus, in principle SAPTA does seem to recognize the risk factor involved in preferential trading amongst unequal partners in terms of asymmetric incidence of benefit. In practice, however, almost nothing has been done to give an operational meaning to this concern. There are several indications of this critical failure.

Rules of Origin: The rule stipulates that in order to qualify for preferential treatment the product must not contain imported inputs more than 50

Bangladesh

per cent of the FOB value of the product. For LDCs, the requirement was lowered to 40 per cent. But this concession granted to LDC is hardly meaningful because these countries will have very few products that have 40 per cent local content.

First Round of Trade Agreement: After exchanging request and offer lists, the SAARC nations finalized the first round schedule of concessions in April 1995. Table 3 gives a summary picture of the agreed concessions. Column 2 in the Table shows the number of items of which concessionary rates were granted by each country; column 3 gives the existing, average unweighted tariff rate in the respective country on the items granted; column 4 shows the average unweighted concessionary tariff rate granted under SAPTA, and finally column 5 indicates the implied rate of concession.

As is evident from the Table, concession granted under the first round of SAPTA agreement is of rather modest magnitude. While the average unweighted tariff rate of the 226 items was 27.2 per cent the average concessionary rate granted under SAPTA was 21.6 per cent.

Secondly, the special treatment accorded to LDCs does not appear to be all that special. While Bangladesh offered a concessionary average rate of 23.1 per cent the rate offered by more industrialized Pakistan was 35.8 per cent. Even India's offer rate of 20.9 per cent is only marginally lower than that of Bangladesh and Bhutan and higher than that of Nepal. Of course, the number of

dia and Pakistan are much larger than those granted by the LDCs. But how relevant are these items in relation to the exports from the countries con-

cerned? Out of the 106 items offered by India for preferential treatment, only 21 commodities currently figure in SAARC intraregional trade. As far as Bangladesh is concerned, only one of the aforementioned 21 commodities (urea/ammonium sulphate) is actively traded with India while another five items are traded at an insignificant level. Only in the case of 18 out of the 214 items, on which other members have offered concessionary tariff rate, Bangladesh had any exports to the SAARC region during 1993-94 and

Thus, the SAARC countries, while agreeing in principle to enhance the level of regional cooperation, have not been able, in the course of the first round of SAPTA negotiations. to make any significant breakthrough in terms of intensifying the existing trade links amongst the member countries or by way of promoting new trading opportunities.

Second Round Trade Negotiations: The second round of trade negotiation was completed in November 1997 covering a total of 1871 products. The main feature of the second round is the inclusion of more items that are relevant for current intra-regional trade and greater degree of tariff concessions. As Table 4 shows degree of concessions varies from 10 to 40 per cent. For LDCs the concession is 5-10 per cent more. There is also the provision of removal of NTB for LDCs for certain items.

Although the concessions granted to LDCs in the second round are more subtantive than before, they are not sufficient to make a significant impact on the current low level of export of these countries. If the LDCs are to be really supported in raising their exports to the re-

gion, bolder action in the form of unilateral free trade facility will be required.

To enhance and diversify Bangladesh's and other LDCs productive capacity and export capability, SAARC cooperation will be needed in the form of finance, technology and market. Although the SAPTA document does talk about all these, hardly any initiative has been taken in this regard.

Historically, the trade per-

formance of SAARC countries varied significantly because of the difference in the size of the respective economies, their structure of production, and pursuance of divergent macro policies. Implementation of SAPTA did not have any bearing on this trend as the scope of SAPTA negotiation remained rather limited. If SAPTA has to impart equitable benefit to the South Asian economies, the concessions granted to LDCs will have to be substantive. In this respect, granting of unilateral free trade facility to LDCs and relaxing the rules of origin are of prime necessity. There is also the need for cooperation in the area of investment, technology transfer and market support to facilitate expansion of the export base of the LDCs.

Until the export capability of the LDCs are improved through these measures, transition to SAFTA will accentuate current inequalities in terms of trade performance. The resulting loss of welfare on the part of the smaller economies may jeopardize their future growth prospect. Transition to SAFTA, therefore, should be put on hold until the pro active role of SAPTA in favour of the LDC's has been fully worked out.

## SME Financing in Bangladesh

## Needed Urgent Reform

by Patrick Meagher HE potential for economic dynamism in Bangladesh depends to a large extent on the growth of small and

The broad gains in terms of economic growth and increased tax revenue to the government would be significant, if not dramatic, and these long-term gains more than offset the short-term costs of change.

able information on potential borrowers and in enforcing loan agreements through the legal system.

Thus, credit market constraints trap willing lenders and borrowers in severe dilemma. Where do these constrains come from? While macroeconomic and cultural influences play a role, the main. sources of the problem are institutional. The legal system does not provide sufficient clarity regarding parties' rights and priorities. In addition, enforcement of those rights is not certain, due to relatively weak court system. As a result, lenders must engage in costly risk management strategies involving extra documentation, background checks, collateral, and guarantees. These provide a kind of insurance, but also result in the high cost of finance. Furthermore, the rule of law is not strong enough to restrain conflicts of interest and corruption in the public sector, or in the system of corporate governance. The combination of legal uncertainty and incentives towards corruption makes SME credit a costly gamble for firms and lenders alike.

From the side of the financial institutions, the repayment risk represented by SMEs is What is to be done? Although relatively low. Smaller enterarrangements in which credit is prises generally have better reextended on less-thanpayment records than large enfavourable terms for the lender terprises, and hence banks and have proven important for the other institutions would like to development of smaller-scale lend to them. However, these industries, this approach does not ultimately offer a solution. lenders face high fixed costs of lending, which make small Substantial reforms are urloans unprofitable. Also, the gently needed in order to bring much greater efficiency to the possibility of a reverse or failcredit market in Bangladesh. ure is always present in the life of an enterprise. Banks and This result will depend on changes in the legal system and other lenders suffer extreme related institutions. It has been difficulties in obtaining reli-

known for some time that legal institutions supporting secure property rights and consistent enforcement of contracts are a necessary condition of rapid and sustainable economic growth. Legal certainty is one of the institutions that encourage specialized investments, including financial transactions, hence promoting growth. A key to achieving a steady high volume of finance, and the growth benefits that this brings, is the extent to which credit is based on objective criteria rather than personal relationships. Where objective standards predominate, they enable the use of a wide range of security by a diversity of finance providers, and therefore a clean and efficient system based on market principles. Achieving this legal cer-

tainty thus requires a targeted reform package:

First, new legislation is needed to make secured finance an engine of growth, as it is in several advanced and rapidly developing economies. A modern law in this area will make it possible for any finance provider, including a bank or any other creditor such as a dealer or supplier, to take and enforce a security interest in collateral of known and stable value. This approach, taken by a number of countries in North America, Europe, and East Asia, allows the use of many types of assets, ranging from inventory to accounts receivable and commercial paper. Such a step is critically needed in order to reduce the dependence of credit in Bangladesh

on real estate mortgage security.

Not only are land and buildings

often not available to SMEs, but obtaining a mortgage is also a costly and uncertain business. Second, legal and organiza-

tional structures that facilitate the flow of information are critically important in financial markets. These should include greatly improved security interest registration mechanisms as well as credit reporting systems. These systems enable creditors to monitor borrowers on the basis of objective information, both before and after a loan is agreed.

Third, the legal and administrative machinery must be adequate in enforcing the rules. Court adjudication, non-judicial enforcement of loan and security agreements, and governance in the public sector and banking system desperately need strengthening. The credit market, especially for SMEs, cannot reach its full potential until such improvements are made.

How can these changes come about in the current atmosphere of Bangladesh? Competitive SMEs, financial institutions, dealers and suppliers, and other potential users of the system such as municipalities, stand to gain substantially from reform. The broad gains in terms of economic growth and increased tax revenue to the government would be significant, if not dramatic, and these long-term gains more than offset the short-term costs of change. The critical question is whether reform can overcome the opposition of those currently able to protect themselves from fair competition, whether openly or illicitly. History shows that societies succeed when they create economic opportunity for the energetic and innovative, not just the well connected. This means having financial markets that give credit where credit is due.
