Chairman of Chittagong port

NURUL ALAM

The need for any private port may not arise with the implementation of the Newmooring Container Terminal (NCT) at Chittagong port, sources said. As a result, the government is

unlikely to give permission for installation of any private container port here if the container handling efficiency of this premier port could be raised with the help of NCT to meet the growing demand, sources added.

The foundation stone of NCT was laid on October 17 by Prime Minister Khaleda Zia with a view to increasing the efficiency of this major seaport of the country to compete with the regional ports and to face the global challenges in trade

The NCT is expected to be commissioned by 2002 and it is supposed to handle 5,00,000 containers annually, port sources said. The NCT will be built at a cost of

Tk 737 crore from the fund of Chittagong PortAuthority.

This will be the second container terminal at Chittagong port. The first container terminal known as Chittagong Container Terminal(CCT) was built at a cost of around Tk 500 crore in 1993.

The CCT was designed to handle 90,000 containers, but it was running over capacity while Chittagong port last fiscal year handled 5,00,000 containers

against the backdrop of growing procure modern equipment includnumber of containers. Port officials hoped that the NCT if commissioned, would fetch addi-

tional revenue earning of Tk 200 crore per vear. The 1000 metre long berth of NCT will be able to handle five

ment

ing gantry cranes for smooth han-"Besides, we have a plan to go dling of container cargo. We will not for more expansion works at be required to depend on any for-Chittagong port," Julfikar said. eign company's private port," Khan Some of the existing jetties also will be turned into container vards Chairman of the Port Users gradually to accommodate more Forum (PUF) and Bangladesh container cargo at Chittagong port. He said that bidding process for procuring gantry cranes for the

existing CCT was already completed. "If we can bring the gantry cranes

under operation, the container handling will definitely be faster," the chairman said.

Chittagong port was set up in 1887 with a capacity of handling 6 million metric tons of bulk cargo annually only. It was not designed for handling container cargo.

Now it is handling more than 12 million metric tons of cargo annually. As the new trend of global containerisation started. Chittagong faced a challenge to cope with the situation.

Then it was forced to set up the CCT, the first terminal for handling the containers

Port sources said container cargo started arriving at Chittagong port from 1977 and then it made a leap with an average increase of 20 percent per year

The Super Sportsmen from Chittagong

MOHIT UL ALAM

The tradition Igbal Khan started was carried on by his younger brothers, one of whom was Akram Khan.

Following the family gene, Akram was a lovely chubby fellow in his childhood days. He would follow his elder brothers to the outfield of Neaz Stadium with bat and ball When Akram was shaping up as a promising player, we had already left the field and started our profes sional careers. It was Pahari (Abul Maqsud, Abul Fazal's youngest son, now a VP of AB Bank, Dilkusha) who first told me about Akram. On a week holiday, we gathered at Pahari's house, that is, Shahitya Niketan, and returned to our old habit of visiting the Neaz Stadium as a group. A league match was going on and Akram was playing for one of the teams. I was surprised to see that the lovely young chubby boy of yesterday had

Part-2

that chubby young boy who carried the cricket gear to the field toeing behind his brothers. Akram is famously polite and soft-spoken, and during

to me he still looked

of Bangladesh cricket, and in our that interview he was so profusely exuberation to give credit to the team in general, we tend to forget to praising Gordon Greenidge that realised that Akram had pursed his take note of the particular contribu-tion each player of the team had soul to Greenidge. He also praised Mohinder Amarnath, the previous made. For example, Pilot's hit of six coach, for teaching them the impor-tance of physical fitness in sports. Neither Akram nor Nannu should image for BTV sports news, did feel bad about the fact that they're bring the victory for Bangladesh. But before that, the innings that was no longer in the Bangladesh team as they've already carved an impor played by Akram against Holland

tant niche in this country's cricket history. Nannu, that is, Minhazul was the phoenix-innings that retrieved Bangladesh's hopes from Abedin, came to cricket a few years earlier than Akram did. He is the the ashes of ruin, and stopped a revisit of the ghost of the failure in oungest son of martyr Shamsul Abedin who used to play cricket for Akram's score was nothing, a a national bank in Pakistan time. had We saw him playing at Neaz Staalready made their way back to the dium, opening for his team. He was an attractive stroke player, and loved to plav shots. Nannu, probaresembles his father more closely both in looks and plaving style than does his elder brother Nobel, also an ex-national player. Shamsul Abedin is the eldest son of the great Junu Meah (Jainal Abedir Chowdhury) whose ancient house at Love Lane has turned itself into a colony, known as Abedin Colony On a fateful night in 1971 Shamsul Abedin was picked by the Punjabi soldiers from his father's house, and was killed. It fell to his voung wife to raise the two young

boys, Nobel and Nannu toddlers in the fashion of their illustrious father. So far as my knowledge goes, Nannu probably had spent some time in England plaving cricket, a training phase that stood him in good stead many a

There was some kind of fiasco in the meeting of the national cricket selection board, and Nannu was ominously dropped from the side that would soon leave to play the World Cup '99 in England. It was not Nannu's form that was in question. but some kind of mysterious political overture that forced the axe on the player. However, good sense finally prevailed, Nannu was also sent with the team, and the rest is history

In a very inclement weather, the match against Scotland was almost turning into a nightmare for Bangladesh. But only Nannu stuck to his juns, while others fell like ninepins It was the innings of his life, Bangladesh won, and he became the man of the match. One of the commentators expressed his surprise to know that the player was initially not chosen for the national side. With Nannu and Akram retired Chittagong has now no player to represent in the national side. Chittagong cricket is in a shambles, and the management of cricket and football must have fallen into very inept hands.

Ballast water - menace to world's oceans

PHOTO: STAR

CAPTAIN HABIBUR RAHMAN

The world's oceans are under threat from over fishing and from physical destruction. Discharges of oil. noxious liquid substances, sewage, garbage from ships and shore are other major threats to oceans. As if this is not enough. they are also under threat from alien invaders the aquatic organism and pathogens transported beyond their natural range and dispersed across the globe by the shipping.

The Global Task Force was convened by IMO in alliance with the United Nations Development Programme(UNDP) and the Global Environment Facility (GEF). The Task Force launched a concerted response to this severe environmental problem. The new initiative is the Global Ballast Water Management Programme, or Globallast.

Over 80 per cent of the world's commodities are carried by ships alone and to keep the ship balanced and stable it transfers around 10 billion tonnes of ballast water each year. For safer shipping ballast is essential but problem arises when it contains marine life and poses a serious ecological, economic and health threat. There are thousands of species that may be carried in ship's ballast, which includes bacteria, cysts, and a larvae of various species.

Initiative to overcome the problem

During the Task Force meeting in London in July 2000, international environmental group Friends of the Earth described the Globallast

programme as "the most exciting environmental project in the world

todav IMO's Marine Environment Protection Committee (MEPC) is working on developing mandatory regulations to address the problem of the transfer of harmful aquatic organisms in ballast water.

The MEPC has continued to give priority to the development of a global ballast water management regime. In order to speed up the work, the draft text of a new mandatory instrument will be further developed at the inter-sessional meeting during the week immediately preceding the committee's 48th session (MEPC 48, October 7-11, 2002)

Current options for preventing the spread of harmful aquatic organisms in ballast water include exchanging the ballast water in deep ocean, where there is less

marine life and where organisms are less likely to survive. Other options include various treatments of the ballast water en route to kill the living organisms these include filtration, chemical, and radiation treatments.

At the international level, it is likely that the new IMO Ballast Water Convention will be adopted in 2003. This will hopefully bring with it global standards and procedures for the evaluation, approval and adoption of new treatment technologies. Ten of the Most Unwanted:

Marine plants, animals and microbes are being carried around the world attached to the hulls of

Some epidemics appear to be directly species may contaminate filterassociated with ballast water. One feeding shellfish and cause fisherexample is an epidemic that began ies to be closed. Consumption of contaminated shellfish by humans simultaneously at three separate ports in Peru in 1991, sweeping may cause severe illness and across South America, affecting death

> Round Goby: Native to: Black, Azov and Caspian Seas. Introduced to: Baltic Sea and North America. Impacts: Highly adaptable and invasive. Increases in numbers and spreads quickly. Completes for food and habitat with native fishes including commercially important species, and preys on their eggs and young. Spawns multiple times per season and survives in poor water quality.

North American Comb Jelly: Native to: Eastern Seaboard of the Americas. Introduced to: Black, Azov and Caspian Seas. Impacts: Reproduces rapidly (self-fertilising hermaphrodite) under favourable conditions. Feeds excessively on zooplankton. Depletes zooplankton stocks; altering food web and ecosystem function. Contributed significantly to collapse of Black and Azov sea fisheries in 1990s, with massive economic and social impact. Now threatens similar impact in Caspiar

and 2000

North Pacific Seastar : Native to: Northern Pacific Introduced to: Southern Australia. Impacts: Reproduces in large

numbers, reaching 'plague' proportions rapidly in invaded environments. Feeds on shellfish, including commercially valuable scallop, oyster and clam species.

Zebra Mussel: Native to: Eastern Europe (Black Sea). Introduced to: Western and northern Europe, including Ireland and Baltic Sea eastern half of North America. Impacts: Fouls all available hard surfaces in mass numbers, displaces native aquatic life. alters habitat, ecosystem and food web, causes severe fouling problems on infrastructure and vessels, blocks water intake pipes, sluices and irrigation ditches. Economic costs to USA alone of around US\$ 750

million to \$ 1 billion between 1989

Asian Kelp: Native to: Northern Asia. Introduced to: Southern Australia. New Zealand. West Coast of

USA. Europe and Argentina. Impacts: Grows and spreads rapidly, both vegetatively and through dispersal of spores. Displaces native algae and marine life. Alters habitat, ecosystem and food web. May affect commercial shellfish

stocks through space competition and alteration of habitat European Green Crab: Native

to: European Atlantic Coast Introduced to: Southern Australia. South Africa, USA and Japan. Impacts: Highly adaptable and invasive. Resistant to predation due to hard shell. Competes with and displaces native crabs and becomes a dominant species in invaded areas Consumes and depletes wide range of prev species. Alters inter-tidal rocky shore ecosystem
