

ASSISTED REPRODUCTION

Test tube clinics becoming popular

SHAHNAZ PARVEEN

May 30, 2001 was no ordinary day for Bangladesh. The country's first test tube triplets -- Hira, Moni and Mukta -- were born on that day, leaving the experimental days behind. Things have changed since then. A number of test tube baby clinics have been set up in the city offering the latest available treatment to the infertile couples.

"Middle class and lower middle class couples are coming to us every day wishing to have a baby. It was a taboo only a few years ago. Now people's mindset has changed a lot. Even people from outside Dhaka are now coming to us," said Dr Parveen Fatema who works with the Centre for Assisted Reproduction.

As the demand rises, the number of clinics and hospitals offering assisted reproduction service are increasing. The success rate of these clinics is around 30 percent. There are five clinics in the city that have already introduced the test tube baby method. Six more are going to be set up soon. They have already set up necessary lab instruments.

Afsana Ahmed (not her real name) became a mother of twins three months ago after receiving the treatment. "I had

New technology in health sector is becoming popular.

everything in my life, yet I felt really unhappy. After the twins arrived, my life has got a meaning," she said.

"In our society a woman who

cannot give birth to a child has to go through painful experiences. Even when the problem is with the husband, the society blames the wife. This is such a painful issue. Although I went through many physical problems, the test tube babies finally brought hope and joy in my family," Afsana added.

Misconceptions still prevail among people seeking help. Dr Mostak Ahmed of Harvest Infertility Care explained that most people come to their clinic with misapprehension. "It is not a miracle cure for infertility. People often fail to understand that."

Forty-four year old Nurunnessa tried test tube baby several times but never succeeded. "When I first heard of test tube baby, I got the impression that it is some type of magic cure for infertility. Most people around me have this misconception," she said.

"People expect instant result. But we know it always takes several attempts to succeed. It requires patience and a huge amount of money," explained Dr Fatema.

The procedure is still very expensive. Most clinics charge more than Tk 2 lakh for one package. As more than one

attempt is necessary, the expenditure goes up. "Although this is expensive and lengthy process, middle and lower middle class people are showing interest. They are ready to manage money despite difficulties," mentioned Dr Fatema.

While it raises hope for many childless couples, it is not always satisfying for everyone.

Afsana mentioned that there are some negative aspects in Bangladesh that need to be addressed. "Doctors in Bangladesh do not always explain all the side effects. They give too much hope to the patient. Later when the attempt fails they blame the mother. They should explain beforehand about the chances," she said.

"In my case when I failed to conceive, my doctor announced that I was incapable. This led to misunderstandings between me and my husband."

"Both doctors and the family members here pay too much attention to the foetus while ignore physical problems of the mother. Family wants an outcome of the investment while doctors want to save their name," she said.

Doctors however disagree

with her. "If the mother is not physically fit the child as well will have difficulties. Because of the money involved in the process, family members take special care of the mother," said Dr Fatema.

Many couples cannot trust Bangladeshi doctors and they go to India, Thailand or Singapore, where Afsana claimed that doctors are more compassionate.

The issue also raises question whether it will subject women of our society to a different form of torture. Nurunnessa continued with the ordeal of a childless woman. "Women in our country cannot take decision about their own life. I became a guinea pig for my family. They've tested everything possible on me for a baby."

While infertile couples wait for miracles to happen, thousands of parentless, helpless children stay on the streets. Social taboo also exists about adopting them. Nurunnessa mentioned about her wishes to adopt one but was discouraged by her husband and other family members. Muslim law too does not approve adoption.

Wanted: Medical technologists

FROM PAGE 21

In the physiotherapy faculty of the institute there is one assistant professor, one guest lecturer and one technologist working on deputation. But the sanctioned manpower for this faculty is 16.

Another problem is that the institute does not have subject wise teachers. In the radiology faculty there is no radiologist or radiotherapist, so a teacher of lab technology is teaching the subject.

IHT Principal Dr Md Golam Rabbani and its teachers said the main problem of IHT is there is no scope for their students to do graduation after passing a three-year course from IHT. The students suffer from depression as there is no opportunity for promotion in their job.

They said IHT can pro-

duce a good number of skilled technicians who can be sent abroad as there is a good demand for technologists in the Middle East and Australia. "If we could export one health technologist he could earn remittance equal to that of ten labourers for the country," said the principal.

"A few months ago a team from Australia visited IHT. They proposed that if we could teach our students according to their curriculum, then they would employ all the students in Australia, which was a big opportunity. But we could not avail this chance because we did not have BSc course," he said.

IHT should be under Dhaka University and its degrees should be made equivalent to HSC so that the students can do graduation, he said.

In 2006, the total number of students passed from IHT, Dhaka was 176. Among them, 34 are lab technologists, 29 radiologists, 32 pharmacists, 37 are SIs, 25 in dentistry and 19 physiotherapists. Among them 39 are female.

Among existing technologists the male-female ratio is grossly lopsided. From 1979 to 2005 there were only 334 female diploma pharmacists. Besides, there was no female radiotherapist till 2006.

Skill in English language and IT, skill-based curriculum, creation of new posts, development of career plan, improving exam taking system, establishing quality assurance scheme (QAS) and accreditation body is some essential steps to improve shortage of skilled technologists in health sec-
