

Swiss Army Sunglasses

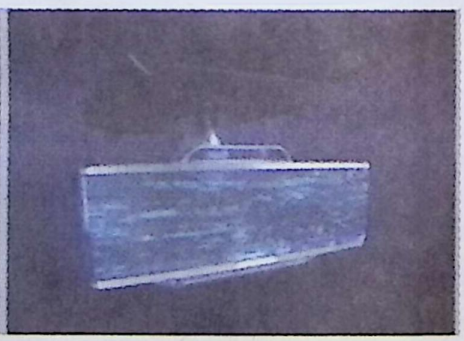

Yes, these are Swiss Army Sunglasses. You can choose from over 240 different tools to put in it, including paintbrushes, a backscratcher, and a variety of knives. The biggest tool, of course, is you, who thinks not only that these aren't the fashion and design abomination that they are but also think they're worth the 400 USD price tag. If only they came with an attachment to restore your self-respect.

High-Tech GM Car Accessory Concepts

Sure, we look at high-tech car concepts all the time and our blogging cohorts, Jalopnik do even more, but how often do we get a chance to see actual car accessory concepts. GE has a few with the key fob, luxury lighting and high-tech rear-view mirror. The key fob is simply a better looking key that has more of a jewellery feel to it. The luxury lighting adds recessed lighting to places that normally don't have lighting, such as the above blinker. The high-tech rear-view mirror actually uses video and cameras, rather than actual mirrors. So how long until we see some of these in our actual vehicles? Well, if Will Smith knew, he would say beyond 2035. I, Robot took place in 2035 and they had automatic driving cars, but no fancy rear-view, recessed lighting or jewellery-like keys.

One Quick Tryke

Electric tricycles seem to be a growing trend, and we can now add this VentureOne to that list. This one gives you a choice of either all-electric or hybrid power. It leans when you turn, can reach 0-60 in 6 seconds and goes 100mph with an impressive 100mpg fuel efficiency. Perhaps the most startling of all is its price, 18,000 USD for the hybrid drive Venture E50, up to 23,000 USD for the all-electric drive Venture EV. We're most interested in that all-electric model, even though its top speed is just 75mph with a range of 120 miles.
