movie *The Machinist*, you will realise that there are some pretty serious consequences to your body if you go without sleep for a long duration (say a week) no matter how awake your brain is. But for pilots going long distances and narcoleptics (who have a lack of Orexin A in their brains, hence the discovery of this drug), it could be quite useful. Not to mention university students the night before finals and hard core Warcraft addicts (like myself) will all find this discovery to be quite an interesting read. It's not out in the market just yet as it's still being tested so for the time being, try and get all the sleep you can get.

Since I'm on the topic of sleep, Toyota's invention of sticking a camera in the dash of a car to monitor the eyelids for dozing off seems pretty smart, even if the gimmick has been around for quite a long while. A beam will mainly be there to monitor your upper and lower eyelids and see whether it's properly open. Well, if you're going for a long drive then I would definitely recommend this hi-tech camera kit along with a puff of Orexin A. That should do the work.

Now if you had a slap bracelet back in the day, you will surely enjoy this concept device from the Chocolate Agency. Imagine a full-fledged multimedia device that can be slapped on and worn like a wristband. It would feature an e-paper surface and a battery that can be recharged using kinetic energy. Unfortunately, imagining it is all you can really do, because this sort of device is a massive pipe dream at the moment. But there is nothing wrong with thinking big.

Another thing in Chocolate Design Agency's pipeline is to create the best phone, ever. The design is modeled around the same E-Paper Slap Bracelet, but this time the e-paper systemfour layers of sustainable material, and an Organic Radical batteryis put to use in the P-Per cellphone concept, which shows a transparent display for camera mode and a browser that spans the entire surface of the display. It looks really radical and, who knows, it just might be the perfect competition for the (dare I say) iPhone.

Aquariums are pretty neato decorations, even if you need to imprison a bunch of fish that most people will simply come and make faces at. But if you think a regular old aquarium is cool, take a gander at the Spacearium, the floating aquarium. Suspended from the ceiling, lit up all slick-like, and can be used as a room divider if you so desire. These things are pretty thin, but depending on how long you order yours to be, it can hold between 55 and 73 gallons of water (fresh or salt, depending on your preference). A nice touch is being able to keep the external filtration system up to 15 feet away, keeping the tank itself nice and pristine. The prices for such a beauty is between $4,900 and $8,400, but hey, think of it like a Plasma TV in the realm of aquariums.
