# Infertility: The pain and the hope

DR FATIMA MOMTAZ

At least 15 percent of couples usually experience some degree of infertility with all of its feelings and frustrations at some point in their life. This issue is not less important than our problem regarding over crowded population.

Today, more women and men seeking treatment for infertility are educated and established group of the society. Now-a-days, more women postpone marriage and childbearing until they are in around 30s or even later in mid 30s due to their career — which has contributed the situation.

Lack of knowledge about infertility could also be a potential risk factors. So, it is important for both partners to understand the problems, the treatment that could be offered in the light of current advancement of reproductive science all over the world and issues related to this.

Medical problems

Many couples who are unable to conceive easily may have a specific problem hindering their ability to conceive. In a country like Bangladesh, the common attitude is to blame the female partner.

But practical scenario is quite interesting all over the world, attributing 30% problem to the male; 30% to the female. In about

20% cases fertility problem is traced to the both partners. Even after exhaustive testing, the rest 20% remains unexplained.

Treatments

DHAKA SATURDAY JULY 19, 2008

Recent advancement of infertility treatment falls into six basic areas.

1. Hormonal Therapy 2.Surgical procedure and microsurgery

3.Artificial insemination •Intrauterine insemination

•Gamete intra-fallopian trans-

·Micro-injection intrafallopian transfer (MIFT)

4.Assisted reproductive technology (ART)

•In-vitro fertilization & embryo transfer (IVF-ET) ·Intracytoplasmic sperm

injection and embryo transfer (ICSI-ET) 5.Cryopreservation (preserva-

tion of embryo/sperm in liquid Nitrogen for long time) ·Slow-cooling (Em-

bryo/sperm freezing by low speed of cooling for subsequent •Vitrification (Embryo/sperm

freesing by ultra-rapid speed of cooling) 6.Pre-implantation genetic

diagnosis (PGD) In Bangladesh few of our prom- are almost in primitive stage.

inent physicians have been offering medical and some degree of microsurgical treatments since 1990.

It is a matter of hope that ART treatment has been started by very few private practitioners and IUI is the most commonly used treatment option at this moment in Bangladesh.

However, the initiatives for fighting against, if medical and surgical treatment have been failed to bring successful outcome,

vaginally using insemination frozen by cryopreservation techcatheter. Generally accepted pregnancy rate per cycle by this technique is 10-20%. IVF (In vitro fertilisation)

There are several procedures designed to unite sperm and eggs, and collectively they are called ART.

IVF is the first ART, developed and most commonly used since 1978. This technique is highly effective in overcoming a variety of infertility issues, particularly in tubal dysfunction.

It is a four-stage procedure. Stagel: Controlled ovarian hyper-stimulation is used to stimulate the development of multiple follicles (2-40), to promote final maturation, and

release of the eggs. Stage2: Eggs are retrieved pervaginally under ultrasonic guidance. Stage3: Eggs are transferred to the laboratory where they are fertilised by the prepared sperm

collected freshly from husband

or from previously frozen sperm. Stage4: After fertilisation eggs become embryo and embryos are cultured in the sequential culture medium commonly up to 5 days till it forms blastocyst couples who have previously (when cavity appears inside the embryo). Then usually 1/2

0.2µl-2ml of prepared sperm is uterus per-vaginally under ultrainserted into the uterus per- sonic guidance and rest are nique for future use if the women fail to become pregnant by fresh embryo.

ICSI (Intra-cytoplasmic sperminjection)

It is a micromanipulation technique, whereby a single sperm is immobilised, caught and injected into the egg. This procedure is indicated to overcome the male infertility, unexplained infertility or where sperm are unable to penetrate the egg wall. Other steps are same as IVF technique. This technique has a high fertilisation rate of about 80-90% and pregnancy rate of 40%.

### PGD (Preimplantation genetic diagnosis)

1-2 cells from 3- or 5-day old embryo are collected and analysed using PCR (Polymeric Chain Reaction) technique or FISH (Fluorescent In-Situ Hybridisation) procedure commonly, to diagnose that whether particular embryo has any genetic disease or not. Subsequently only normal embryo is transferred into the uterus. However, this technique is highly expensive and offered only to the diagnosed genetic disease.

or severe pain or the pain is related to injury Understanding the root

cause of back pain is the key causes, we often think about arthritis, osteoporosis or injury related or getting old age. We also talk about muscle strain or sprains of ligaments (which attach bone to bone), swollen joints or a

'slipped disk'.

But there could be something else; like prostate cancer, pancreatic cancer and kidney stones. There can be back pain also due to bone cancers or chronic autoimmune disease.

is using your back muscles in activities you are not used to, like lifting heavy furniture or boxes. So, do not lift by bending over. Lift an object by bending your knees and squatting to pick up the everyhour.

close to your body. If you do push rather than pull when you move heavy objects.

Doctors at the woodend There is life threatening hospital (Scotland) are using resonance imaging (MRI) to show that sitting in an unnecessary strain on back, leading to potentially chronic pain problems if you spendlong hours sitting.

According to Dr Waseem Amir Bashir, author and clinical fellow in the Department of Radiology and Diagnostic Imaging at the University of Alberta Hospital, (Canada), 'a 135-degree body-thigh sitting posture was demonstrated to be the best biomechanical sitting position, as opposed to a 90degree posture, which most people consider normal'. He to right treatment. While found that sitting in a sound talking about the list of anatomic position is essential, since the strain put on the spine and its associated ligaments over time can lead to pain, deformity and chronic illness.

When there is pain, the best position for relief is to lie on your back on the floor with pillows under your knees, with your hips and knees bent and your feet on a chair, or just with your hips and knees bent. This takes the pressure and weight off your back. It is better to take The most common cause 1 or 2 days of this sort of rest. Resting longer than this can cause muscles to weaken, which may slow the recovery. According to some researchers, even if it hurts, walk around for a few minutes

## Emili's dream comes true

3 months old Yousuf was born with cleft lip (a congenital deformity in face that leads to difficulty in feeding and makes susceptible to infections). But his family was unable to bear the expenses of the surgery that could correct his defect. Japan Bangladesh Friendship Hospital (JBFH) has recently organised a health camp at Madaripur district stadium where they identified Yousuf and offered the surgery free of cost. They provided healthcare by specialist physicians and teleconference for more than 1000 people at the camp. After surgical correction, Yousuf's mother is happy
