The B Membrane PC

Conceived by Korean designer Won-Seok-Lee, the 'B-membrane' is one of the most interesting PC prototypes to have come out. The B-membrane looks nothing like a conventional computer, more like a spaceship or space station, but it is indeed a PC, able to project an image of your desktop on any surface you can point its omni-directional projector at, thus rendering even the slimmest LCD monitor useless. It also has a membrane keyboard and mouse that appear only when you need them too, and an optical drive.
The B-membrane isn t useless even when it is shut-down; its smart projector turns it into an ambient light-effects system to spice up the look of your place.
