Mobile Phone Syste

Tahmina Khan Tithi

IN modern Bangladesh mobile phones have become a very integral part of everyone's life. Though there is no reliable statistics, it is quite sure that we consume a good amount of power to charge our mobile phone batteries everyday.

When the fuel inefficient country is suffering from severe energy crisis, experts insist us to be very careful not to waste a single unit of energy. Whenever my NOKIA handset battery is full, it shows a message 'Battery full. Save energy and remove charger from wall socket'. Every time I see the message I thank NOKIA for reminding me to unplug my charger and save the unnecessary wastage of power of priceless electricity.

When the earth is heading towards potentially devastating energy crisis due to a decline in the fuel availability, experts have been working hard to find out suitable alternative. Many recognised handset manufacturers are working to design less power consum and solar powered handsets as well as many mobi communication operators are also interested to ha renewable-energy systems for them.

In recent time India has proposed a plan for so powered cell-phone towers. At the same time a lead Chinese cell-phone operator has already set up world's biggest solar-energy-powered base station their country. These days NOKIA is working to manuf ture cell-phones that will use ambient radio waves. T prototype can provide 50mW power from radio wav which is sufficient to power a cell-phone in stand mode. LG, Samsung, Sharp and some other brands ha launched some latest handsets with all new prototy using solar power.
