NATION NEEDS DIGITAL EDUCATION SYSTEM

Everything has changed with the change of time. The use of information technology has changed our lives radically.

Enlightening popularity of the information technology will be lost, unless the benefits of technology reach the education sector. The practice of using projector in the classroom has gradually started. Building Internet based classrooms is also going on. But these are just a few parts of the education system. In order to digitise the educational system, the educational institution should start from the scratch.

In most of the neighbouring countries, education management software is being used. The presence of students, file management of educational institutions, accounting, teacher's salary management, everything is maintained with the help of software's. In our country, apart from teaching students, a teacher has to do lots of administrative work. These wastes so much time that teacher's focus get diverted and also it kills productive man hour.

But the administration management software is very easy to implement and operate. Many of us think that education management software can't be used in remote schools because the teachers will be unhappy with the use.

If people at the remote areas are sending money using mobile app, making video calls for their own needs then they will also use education management tools. There is no doubt about that. The question is, where can we find good school management software in our country? How one can sort out which software goes well with the institution?

Find out the answers to these questions in BASIS SoftExpo. It has got Digital Education Zone. Where Educational Institute Management Software Developers will participate. One will get the chance to get 360 degree solution under one umbrella.

Visit BASIS SoftExpo from March 19-21, ICCB, Bashundhara. These software's have been developed focusing particularly on Local educational Institutions.
