

Shishir Moral,
Journalist, Prothom Alo

A civil society movement in favour of reducing the prices of medicines is crucial to reducing out-of-pocket expenditure in the healthcare sector. We also need to strengthen Essential Drugs Company Limited (EDCL) because if the government starts producing essential drugs, the prices are bound to go down, ultimately reducing out-of-pocket expenditure. Simultaneously, corrupt officials who are still dealing with the healthcare sector need to be removed from their posts.

Dr Shams El Arifeen,
Senior Director and Senior Scientist, icddr,b

I don't think having our policymakers treated here at home will solve the issues in our healthcare system.

In our country, the "VIP culture" takes precedence over everything, so those in important positions will be prioritised over the common people. Ultimately, they will never get to realise the struggles these people have to face while trying to access healthcare.

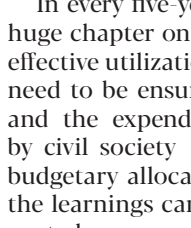

We need to revolutionise and reform our healthcare system from within. Unfortunately, we don't see healthcare being discussed in political discourses. Bureaucracy will never get the system to change, that is a job for political leaders.

Samia Afrin,
Director, Naripokkho

We need to strengthen our monitoring mechanisms and ensure accountability to make our healthcare system work. Hospital management committees usually have a wide array of representation of public representatives at all levels. However, they do not prioritize the issue of healthcare. The common people need to be involved to hold our institutions accountable.

In every five-year plan, there is usually a huge chapter on healthcare the timely and effective utilization of the allocations are in need to be ensured with close monitoring and the expenditure should be reviewed by civil society instead of increasing the budgetary allocation in the sector, so that the learnings can be incorporated into the next plans.

Kaosar Afsana,
Professor, James P Grant School of Public Health, BRAC University

We need a proper review of public expenditures right after the budget proposals every year.

Our healthcare system is not only about the doctors. We need to work as a team, including other healthcare workers as well.

Our government should invest more in science policy interfacing so we can identify the gaps in our system, research how we can address the gap and compare our situation with other sectors. We can engage in dialogue with members of parliament to discuss health issues and involve them. The essential drug policy is an important agenda that needs more focus to reduce out-of-pocket expenses.

SM Shaikat,
Executive Director, SERAC Bangladesh

We must realise the difference between need and right. Since healthcare is not recognised as a fundamental right in our Constitution, we cannot ask for legal help if we are denied medical treatment. The state can only try to make it more accessible for us, but it does not have a liability to ensure access to healthcare.

Our politicians also need some more literacy when it comes to health issues. They need to focus on policies that aim towards making people healthier rather than building infrastructures.

Sharif Mostafa Helal,
Executive Director, BWHC

I agree that health service would improve if political leaders, MOH officials and other VIPs started availing the services offered to the common people from the public health facilities. Unfortunately, that is not how things work in our country. Recently I saw the news that a VIP went to a government eye hospital to seek treatment. While we were busy applauding the move, we conveniently forgot to address how common people seeking treatment at that facility might have been deprived of necessary medical assistance at the time the VIP was there. The reality is that the institutions active at the grassroots levels don't have adequate human resources to treat every patient.

recent years, major health indicators have stagnated. Investment in the health sector has also been stagnant for the past 10-15 years. To improve the health sector and align with both the Sustainable Development Goals (SDGs) and our national plan, the government must increase efficiency in resource utilization and boost budgetary contributions to healthcare. Without these changes, the maternal mortality rate (MMR) won't drop from 194 to 70 by 2030, and out-

Prof. Dr Sameena Chowdhury,
Past-President, OGSB

Hospitals must provide appropriate and necessary facilities and create an enabling environment to encourage women to seek services. The lack of quality in hospital services often discourages recipients from seeking care. Improving service quality requires not only equipment and medicines but also changes in the overall system and in the behavior and practices of service providers.

Service providers should treat recipients with due respect and dignity, promptly providing necessary treatment. Recipients must be informed of all essential information in a timely manner, enabling them to make informed decisions and express their preferences regarding their treatment. Government initiatives are necessary to ensure 'women-friendly' services and to encourage recipients to seek care from public health centers, thereby reducing out-of-pocket expenses. Additionally, the government should allocate the necessary budget to support these initiatives.

Dr Esrat Jahan,
Regional Inclusive Health Specialist - South Asia, Handicap International

In Bangladesh, chronic illness accounts for 51 percent of the current mortality rate, and 42 percent of persons with disabilities suffer from chronic illness. Consequently, out-of-pocket expenditure is higher for persons with disabilities than for other groups, with most living below the poverty line and facing unmet healthcare needs three times greater than the general population. Chronic illness is closely linked to life expectancy, with persons with disabilities having a life expectancy 10-20 years shorter than others. They often cannot access health centres, private health facilities are unaffordable, and government facilities are inaccessible. Service providers are not trained to meet their needs.

95 percent of doctors at upazila-level Health Complexes do not stay at their workstations and instead reside in cities, primarily Dhaka.

of-pocket costs won't fall to 30%.

The private sector plays a crucial role in the health sector. It's time they are brought under government regulations and laws. This will help to ensure quality control, define their roles, and guide their operations. It can also help partially control costs, and reducing out-of-pocket expenditures. The reluctance to collaborate between the Directorate General of Family Planning (DGFP) and the Directorate General of Health Services (DGHS) must be overcome. Their budget allocation and utilization have been decreasing, as seen in past budget and health expenditure analyses. To address this issue, alongside the government's initiatives, the government should also play a significant role in the planning phase and in utilizing additional funding in the health sector for strengthening the health system through bilateral agreements within the development sector. The right skill mix must be considered. It's not just about increasing the number of nurses or doctors; it needs to be ensured that we have the pipeline to meet our targets. Investment in this area is crucial. Nationally, there are approximately 12.4 health related professionals per 10-12,000 people. This number decreases in rural areas and even more in hard-to-reach areas like Char and Haor. We need to move beyond just talking about "leaving no one behind" without a comprehensive plan for the well-being of these communities. This demand should not remain at the planning level; there are opportunities to raise this demand from the community itself. Lastly, with 41 districts now climate-vulnerable, compared to 19 coastal areas five years ago, there is a significant opportunity to address climate and health issues together, as health issues in these vulnerable areas will become more severe in the coming days.

Ayesha Akhter,
Legal Specialist, Gender Justice & Women Empowerment Cluster, Blast

BLAST in a public interest litigation, highlighted a statistical report indicating that

hindering our system's efficacy. If these fundamental issues are not addressed, our healthcare delivery will never reach its full potential.

During my tenure as joint secretary at the health ministry, I have noticed the continued existence of bifurcated service delivery and family planning systems in Bangladesh. This approach contributes to duplication and inefficiencies. Given our constrained health sector budget, maximising resource utilisation is paramount. This requires cohesive collaboration among all healthcare professionals, from doctors to primary caregivers, within a unified framework.

Secondly, decentralisation is often discussed but centralised decision-making remains dominant. This causes delays and gaps in addressing local issues promptly, impacting service delivery. Another crucial issue is the absence of policymakers in our current discourse. While grassroots and mainstream sectors engage in vital conversations, the absence of policymakers undermines the effective implementation of proposed solutions.

I have encountered situations where evidence-based studies compiled were overlooked by policymakers who wield the authority to act. Conversely, those implementing policies lack decision-making authority despite having immense knowledge of the issue derived from experience. This disconnect perpetuates unresolved issues.

Budget shortages are a reality, yet over-budgeting on certain programmes is also prevalent. During my tenure at a community clinic, significant funds remained unspent despite project completion, highlighting inefficiencies in budget utilisation. Pragmatic budgeting could mitigate such discrepancies and optimise resource allocation effectively.

As hypertension and diabetes rates surge in our country, timely provision of medicines in community clinics is crucial. However, interruptions in training due to conflicting government priorities have hindered progress. Effective integration of supervision, monitoring, and training across all levels is essential for improving service delivery and health outcomes.

In conclusion, addressing workforce limitations and enhancing training programmes are critical steps. Realistically, achieving comprehensive healthcare reform requires overcoming systemic challenges and aligning resources efficiently. Given the current state of our workforce and the practical constraints of our training programmes, I must realistically say that achieving this goal is not feasible at the moment.

Therefore, increasing the number of doctors and facilities is not enough, rather strong monitoring and accountability is required. Article 18.1 of Bangladesh Constitution focuses on public health necessitates giving importance to various components, particularly food and nutrition being critical among them. However, the general trend among the lower middle class in our country is to allocate a larger portion of their budget to medical expenses, often at the expense of their food and nutritional budget. As both medical and food costs continue to rise, this approach is unsustainable unless we balance these two essential areas.

Our proposed health budget lacks information on facilities for persons with disabilities. Moreover, there is no health insurance policy for them, and pregnant women with disabilities do not receive their allowances. We need to ensure a multidisciplinary approach to create an inclusive health budget.

Our current procurement system is flawed, designed more for engineering and construction than health. Addressing these malpractices and managing procurements effectively is crucial for improvement in the health sector. Only by tackling these fundamental issues can we hope to see substantial progress.

Today's discussion will shed light on the budget allocation for the health sector of this fiscal year, which is Tk 41,407 crore out of a total budget of Tk 7,97,000 crore. We will try to identify the areas within the health sector where this allocation is being directed, assess the efficient usage of the allotment, and determine what can be done to make the usage more efficient. Additionally, we will discuss how the current scenario supports the effectiveness of the sexual and reproductive health and rights (SRHR) ecosystem.

Today, we discussed a critical issue: health expenditure. Drawing from my extensive experience across various medical colleges during my government service, I reflect on who typically relies on public hospitals—the most vulnerable population who have no other

accurate and comprehensive data. The private health sector has grown significantly, but the lack of data from this sector creates a persistent gap in health sector discussions. After Covid-19, we anticipated emergency funds and preparations to handle future health crises, but a critical review of our health budget is needed to see if it meets these expectations.

Our health system's workforce structure is not proportionate to the demand for health care. We need to evaluate whether our system is prepared to meet this demand. While our infrastructure, from the central to the community level, is excellent compared to neighboring countries, our workforce and support team are not sufficient in number and simultaneously lacks the necessary skills to effectively utilize resources and carry out their functions.

Currently numerous programmes being implemented in the upazila and higher-level health facilities. However, the management workforce has remained the same at the Upazila and district level since the British era. It is difficult to manage and supervise with this limited workforce and more personnel should be allocated for effective management. Otherwise unrealistic expectations can hinder progress.

I pose this question to the media and civil society and other stakeholders who have grave responsibilities: Instead of solely scrutinising doctors for healthcare quality, how conducive are the infrastructures and health management systems in place for them to succeed in providing quality services at minimum cost?

options. The dedicated service provided by doctors in these institutions often goes unnoticed on a broader scale.

To address medication costs, it is crucial not only to reduce prices but also to ensure their widespread availability. For instance, coordinating a comprehensive care plan for pregnant women over nine months could optimise medication usage, aligning specific needs with each trimester. Regarding community clinics, while impressive infrastructure exists at various levels, coverage gaps remain. Although doctors are required to serve in rural areas for two years post-MBBS, there should be provisions for promotion to encourage sustained commitment to these underserved regions.

To enhance service quality, we must focus on robust planning and training for healthcare providers. While many essential medications are now accessible, gaps persist in availability, for instance, leading to substitutes like Magsulf, a very simple medication. Addressing out-of-pocket expenses for patients, especially for essential surgeries, is crucial and it becomes so difficult for ordinary people to pay such hefty amounts.

It is important to note that efforts to minimise operation costs are essential, ensuring affordability without compromising quality. By optimising budget allocations and refining service delivery strategies, we can bridge these gaps in our healthcare system effectively.

Syed Abdul Hamid, Professor, Department of Health Economics, University of Dhaka

For budget allocation, we are supposed to receive 12-15 percent, but instead, we only get 5.2 percent. This is

nearly 10 percent less than what is needed. Why is it so low? Why can we not spend the allocated amount effectively?

The finance ministry sets a budget ceiling for each ministry, typically a 5-10 percent increase from the previous year. The health minister cannot exceed this ceiling unless an emergency, such as Covid-19, arises. This macro-level budgeting process means that the actual needs of patients and doctors are not fully reflected or met. Despite the Medium-Term Budgetary Framework (MTBF) process, where projects are supposed to be planned and budgeted for over three years, this ideal scenario often does not match reality.

Another issue is that budget requests must be tied to specific items. In the health sector, we have a high demand for human resources, including doctors, nurses, and technologists, down to the supporting staff. Timely recruitment in the health ministry is essential, yet it involves multiple layers of approval from DG Health, public administration, and finance. This bureaucratic process often delays recruitment and hampers budget allocation.

Critical sectors such as maternal care, neuroscience, and cancer care are severely understaffed. For instance, we have around 200-250 oncologists when we need approximately 1,500. By creating positions and recruiting more professionals in these vital areas, we can justify higher budget allocations. Additionally, many clinical centres need upgrades, we lack dedicated medical stores, and facilities are often inadequate. Addressing these deficiencies requires a bottom-up approach and comprehensive improvement plans.

Why can we not spend the budget effectively? There are three main reasons. First, factors like finance, procurement, and audit processes are often beyond the Health Ministry's control. Second, internal issues within the health ministry itself contribute to inefficiencies. Third, poor communication between facilities and DG Health exacerbates these problems.

A significant issue is the lack of training for facility managers and administrators. We have repeatedly advocated for a dedicated training programme for these roles, focusing on procurement, accounting, and finance from day one in the BCS. Proper training would bridge knowledge gaps and improve efficiency.

Our current procurement system is flawed, designed more for engineering and construction than health. Addressing these malpractices and managing procurements effectively is crucial for improvement in the health sector. Only by tackling these fundamental issues can we hope to see substantial progress.
